17 Equations That Changed the World

Ian Stewart

A circular collage of colorful sticky notes (yellow, orange, blue, green) featuring various mathematical formulas. The formulas are arranged in a circular pattern, overlapping each other. The formulas include:

- $E = mc^2$
- $\nabla \cdot \mathbf{D} = \rho$
- $\nabla \times \mathbf{H} - \frac{\partial \mathbf{D}}{\partial t} = \mathbf{J}$
- $F = G \frac{m_1 m_2}{d^2}$
- $\frac{\partial^2 u}{\partial x^2} = c^2 \frac{\partial^2 u}{\partial t^2}$
- $0 = A^T V - \frac{\partial}{\partial V} \frac{\partial \mathcal{L}}{\partial S} + \frac{\partial}{\partial S} \frac{\partial \mathcal{L}}{\partial V} + \frac{\partial}{\partial S} \frac{\partial \mathcal{L}}{\partial S} (SO)^2 \frac{1}{2}$
- $\log xy = \log x + \log y$
- $\phi(x) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$
- $F - E + V = 0$
- $x_{t+1} = kx_t(1-x_t)$
- $H(x) = -\sum_x p(x) \log p(x)$
- $i^2 = -1$
- $\frac{\partial}{\partial t} \psi = \hat{H} \psi$
- $\frac{\partial}{\partial x} \left(\frac{\partial \psi}{\partial x} + v \cdot \nabla \psi \right) = -\nabla \psi + \dots$
- $\frac{df}{dx} = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$
- $\hat{f}(\xi) = \int_{-\infty}^{\infty} f(x) e^{-2\pi i x \xi} dx$
- $dS \geq 0$
- $\mathbf{E} = -\nabla \phi$
- $\mathbf{B} = \nabla \times \mathbf{A}$
- $\frac{\partial^2 u}{\partial x^2} = c^2 \frac{\partial^2 u}{\partial t^2}$

Transport Equation

$$f_t = f_x$$

- Signal processing
- Advection
- Traveling waves

Heat Equation

$$f_t = f_{xx}$$

- 
- Heat propagation
 - Diffusion
 - Smoothing

$$f_t = f_{xx}$$

Evolution of Good

Nowak Automaton

Wave equation

- Light
- Sound
- Particles

$$f_{tt} = f_{xx}$$

Good vibrations

Wave Equation

The diagram shows the wave equation:
$$\frac{\partial^2 u}{\partial t^2} = c^2 \frac{\partial^2 u}{\partial x^2}$$
 with the following labels:

- $\frac{\partial^2 u}{\partial t^2}$: second partial derivative with respect to time
- $\frac{\partial^2 u}{\partial x^2}$: second partial derivative with respect to space
- c : speed squared
- u : displacement

What does it say?

The acceleration of a small segment of a violin string is proportional to the average displacement of neighbouring segments.

Why is that important?

It predicts that the string will move in waves, and it generalises naturally to other physical systems in which waves occur.

What did it lead to?

Big advances in our understanding of water waves, sound waves, light waves, elastic vibrations... Seismologists use modified versions of it to deduce the structure of the interior of the Earth from how it vibrates. Oil companies use similar methods to find oil. In Chapter 11 we will see how it predicted the existence of electromagnetic waves, leading to radio, television, radar, and modern communications.

Laplace Equation

$$f_{xx} + f_{yy} = 0$$

Chladni Patterns

For networks

Burgers Equation

$$f_t + f f_x = 0$$

Schocks

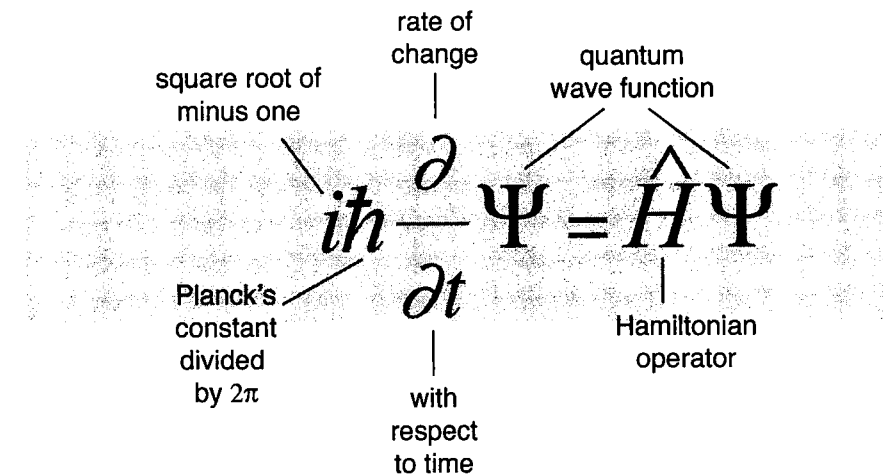

Schrödinger equation

$$i f_t = f_{xx} + V(x) f$$

14 Quantum weirdness

Schrödinger's Equation

The diagram shows the Schrödinger equation with various parts annotated:

- i : square root of minus one
- \hbar : Planck's constant divided by 2π
- $\frac{\partial}{\partial t}$: rate of change with respect to time
- Ψ : quantum wave function
- \hat{H} : Hamiltonian operator

$$i\hbar \frac{\partial}{\partial t} \Psi = \hat{H} \Psi$$

What does it say?

The equation models matter not as a particle, but as a wave, and describes how such a wave propagates.

Why is that important?

Schrödinger's equation is fundamental to quantum mechanics, which together with general relativity constitute today's most effective theories of the physical universe.

What did it lead to?

A radical revision of the physics of the world at very small scales, in which every object has a 'wave function' that describes a probability cloud of possible states. At this level the world is inherently uncertain. Attempts to relate the microscopic quantum world to our macroscopic classical world led to philosophical issues that still reverberate. But experimentally, quantum theory works beautifully, and today's computer chips and lasers wouldn't work without it.

Navier Stokes

$$\mathbf{f}_t + \mathbf{f} \cdot \nabla \mathbf{f} = \nabla^2 \mathbf{f} + \mathbf{F}(\mathbf{u}, p)$$

10 The ascent of humanity

Navier–Stokes Equation

The diagram shows the Navier-Stokes equation with labels pointing to its various parts:

- density** points to ρ .
- velocity** points to \mathbf{v} .
- time derivative** points to $\frac{\partial}{\partial t}$.
- dot product** points to $\mathbf{v} \cdot \nabla$.
- gradient** points to ∇ .
- pressure** points to p .
- stress** points to \mathbf{T} .
- body forces** points to \mathbf{f} .
- divergence** points to $\nabla \cdot$.

$$\rho \left(\frac{\partial \mathbf{v}}{\partial t} + \mathbf{v} \cdot \nabla \mathbf{v} \right) = -\nabla p + \nabla \cdot \mathbf{T} + \mathbf{f}$$

What does it say?

It's Newton's second law of motion in disguise. The left-hand side is the acceleration of a small region of fluid. The right-hand side is the forces that act on it: pressure, stress, and internal body forces.

Why is that important?

It provides a really accurate way to calculate how fluids move. This is a key feature of innumerable scientific and technological problems.

What did it lead to?

Modern passenger jets, fast and quiet submarines, Formula 1 racing cars that stay on the track at high speeds, and medical advances on blood flow in veins and arteries. Computer methods for solving the equations, known as computational fluid dynamics (CFD), are widely used by engineers to improve technology in such areas.

Navier-Stokes Equation

Waves follow our boat as we meander across the lake, and turbulent air currents follow our flight in a modern jet. Mathematicians and physicists believe that an explanation for and the prediction of both the breeze and the turbulence can be found through an understanding of solutions to the Navier-Stokes equations. Although these equations were written down in the 19th Century, our understanding of them remains minimal. The challenge is to make substantial progress toward a mathematical theory which will unlock the secrets hidden in the Navier-Stokes equations.

Eiconal Equation

$$f_x^2 + f_y^2 = 1$$

Maxwell equations

$$\text{div}(\mathbf{B}) = 0$$

$$\text{div}(\mathbf{E}) = 4 \pi \rho$$

$$\text{curl}(\mathbf{E}) = -\mathbf{B}'/c$$

$$\text{curl}(\mathbf{B}) = \mathbf{E}'/c + 4 \pi \mathbf{j}/c$$

11 Waves in the ether

Maxwell's Equations

The diagram shows the four Maxwell's Equations with labels for their components:

- $\nabla \cdot \mathbf{E} = 0$: divergence (of electric field)
- $\nabla \cdot \mathbf{H} = 0$: divergence (of magnetic field)
- $\nabla \times \mathbf{E} = -\frac{1}{c} \frac{\partial \mathbf{H}}{\partial t}$: curl (of electric field), magnetic field, speed of light, rate of change with respect to time
- $\nabla \times \mathbf{H} = \frac{1}{c} \frac{\partial \mathbf{E}}{\partial t}$: curl (of magnetic field), electric field, speed of light, rate of change with respect to time

What do they say?

Electricity and magnetism can't just leak away. A spinning region of electric field creates a magnetic field at right angles to the spin. A spinning region of magnetic field creates an electric field at right angles to the spin, but in the opposite direction.

Why is that important?

It was the first major unification of physical forces, showing that electricity and magnetism are intimately interrelated.

What did it lead to?

The prediction that electromagnetic waves exist, travelling at the speed of light, so light itself is such a wave. This motivated the invention of radio, radar, television, wireless connections for computer equipment, and most modern communications.

Black Scholes

$$f_t + f f_x = f - x f_{xx}^2$$

17 The Midas formula

Black-Scholes Equation

The diagram shows the Black-Scholes equation with labels pointing to its various parts:

- $\frac{1}{2}$: rate of change of rate of change
- σ^2 : volatility
- S^2 : price of commodity
- $\frac{\partial^2 V}{\partial S^2}$: rate of change of rate of change
- rS : price of financial derivative
- $\frac{\partial V}{\partial S}$: rate of change
- $\frac{\partial V}{\partial t}$: with respect to time
- r : risk-free interest rate
- V : price of financial derivative

$$\frac{1}{2} \sigma^2 S^2 \frac{\partial^2 V}{\partial S^2} + rS \frac{\partial V}{\partial S} + \frac{\partial V}{\partial t} - rV = 0$$

What does it say?

It describes how the price of a financial derivative changes over time, based on the principle that when the price is correct, the derivative carries no risk and no one can make a profit by selling it at a different price.

Why is that important?

It makes it possible to trade a derivative before it matures by assigning an agreed 'rational' value to it, so that it can become a virtual commodity in its own right.

What did it lead to?

Massive growth of the financial sector, ever more complex financial instruments, surges in economic prosperity punctuated by crashes, the turbulent stock markets of the 1990s, the 2008–9 financial crisis, and the ongoing economic slump.

The End

O. Knill, October 7, 2019
