

INTRODUCTION TO CALCULUS

MATH 1A

UNIT 12: WORKSHEET

Problem 1: Let $f(x) = x^3 - 12x$.

- Find all critical points of f .
- Use the first derivative test to find the maxima and minima.
- Use the second derivative test to find maxima and minima.
- Now use this information to draw the graph of f .

Problem 2: Find the maxima and minima of the function $f(x) = 3|x| - x^3$ following the same path as in the previous problem. To get started, first look at what happens for $x > 0$ and then for $x < 0$.

Problem 3:

You see the graph of a continuous function f . It is called the **Big W** function.

- identify the intervals where f is increasing
- identify the intervals where f is decreasing.
- identify the intervals where f is concave up.
- identify the intervals where f is concave down.
- Which points are critical points of f ?
- Which points are local maxima?
- Which points are local minima?
